What is log?

A logarithm is the inverse operation to exponentiation. For a given number x , the logarithm $\log_b(x)$ is the power to which the base b must be raised to obtain x .

Mathematically:

$$\log_b(x) = y$$

if and only if

$$b^y = x$$

For example:

$$\log_2(8) = 3$$

because $2^3 = 8$.

Basic Properties of log

1. Product Rule:

$$\log_b(xy) = \log_b(x) + \log_b(y)$$

2. Quotient Rule:

$$\log_b\left(\frac{x}{y}\right) = \log_b(x) - \log_b(y)$$

3. Power Rule:

$$\log_b(x^k) = k \cdot \log_b(x)$$

4. Change of Base Formula:

$$\log_b(x) = \frac{\log_k(x)}{\log_k(b)}$$

This is useful for converting between different bases.
